

Python Built-in Functions Cheat Sheet (Grouped by Topic)

■ Basic Input/Output & Type Checking

Function	Purpose
print()	Displays output to the console
input()	Takes input from the user
type()	Returns the type of an object
id()	Returns the memory address of an object
help()	Opens the help system for documentation
dir()	Lists attributes/methods of an object
callable()	Checks if an object is callable like a function

■ Type Conversion (Casting)

Function	Purpose
int()	Convert to integer
float()	Convert to float
str()	Convert to string
bool()	Convert to boolean
complex()	Convert to complex number
list()	Convert to list
tuple()	Convert to tuple
set()	Convert to set
dict()	Convert to dictionary
frozenset()	Convert to immutable set
bytes()	Convert to bytes object
bytearray()	Convert to mutable bytes
memoryview()	Create a memory view object

■ Numeric & Math Functions

Function	Purpose
abs()	Absolute value
pow()	Power (a^b)
round()	Round to nearest integer or decimal

min()	Smallest value
max()	Largest value
sum()	Sum of iterable
divmod()	Returns (quotient, remainder)
bin()	Convert to binary string
oct()	Convert to octal string
hex()	Convert to hexadecimal string

■ Character & String Handling

Function	Purpose
ord()	Unicode code point of a character
chr()	Character from a Unicode number
ascii()	String with non-ASCII chars escaped
repr()	String representation of an object

■ Sequence & Iterable Functions

Function	Purpose
len()	Number of items
sorted()	Returns sorted list
reversed()	Returns reversed iterator
enumerate()	Returns index-value pairs
zip()	Combines iterables element-wise
all()	True if all elements are truthy
any()	True if any element is truthy
filter()	Filters items by function
map()	Applies function to items
range()	Sequence of numbers

■■ Object & Class Functions

Function	Purpose
isinstance()	Check if object is instance of a class
issubclass()	Check if class is subclass of another
vars()	Dictionary of an object's attributes
property()	Creates a property
classmethod()	Defines a class method

staticmethod()	Defines a static method
super()	Calls parent class methods

■ Evaluation & Execution

Function	Purpose
eval()	Evaluates a string as Python code
exec()	Executes a string of Python code
compile()	Compiles code into a code object

■ Miscellaneous Utilities

Function	Purpose
hash()	Returns hash value
format()	Formats a value
globals()	Dictionary of global variables
locals()	Dictionary of local variables
open()	Opens a file
__import__()	Dynamically imports a module
object()	Base object
slice()	Creates a slice object
delattr()	Deletes an attribute
getattr()	Gets an attribute
hasattr()	Checks if object has attribute
setattr()	Sets an attribute
breakpoint()	Debugging breakpoint
